

## Assignment No. 4 & 5

### Class, Object, Constructor & Constructor chaining

1.Create a class named 'Student' with String variable 'name' and integer variable 'roll\_no'. Assign the value of roll\_no as '2' and that of name as "John" by creating an object of the class Student.

```
1  /*1.Create a class named 'Student' with String variable 'name' and integer variable 'roll_no'. Assign the value of roll_no as '2' and that of name as "John" by creating an object of the class Student.*/
2  class Student {
3      String name;
4      int roll_no;
5      public void setValue(String a, int b) {
6          name = a;
7          roll_no = b;
8      }
9      public void display() {
10         System.out.println("Name = " + name + " & Roll Number = " + roll_no);
11     }
12 }
13 }
14 public class Que1 {
15
16     Run main | Debug main
17     public static void main(String[] args) {
18         Student s1 = new Student();
19         s1.setValue("John", 2);
20         s1.display();
21     }
22 }

Area of a Rectangle having length 5.0 & 8.0 is = 40.0
PS C:\Users\Shweta\Documents\JAVA Assignment No. 4 & 5> 
```

5. Write a program to print the area of two rectangles having sides (4,5) and (5,8) respectively by creating a class named 'Rectangle' with a method named 'Area' which returns the area and length and breadth passed as parameters to its constructor.

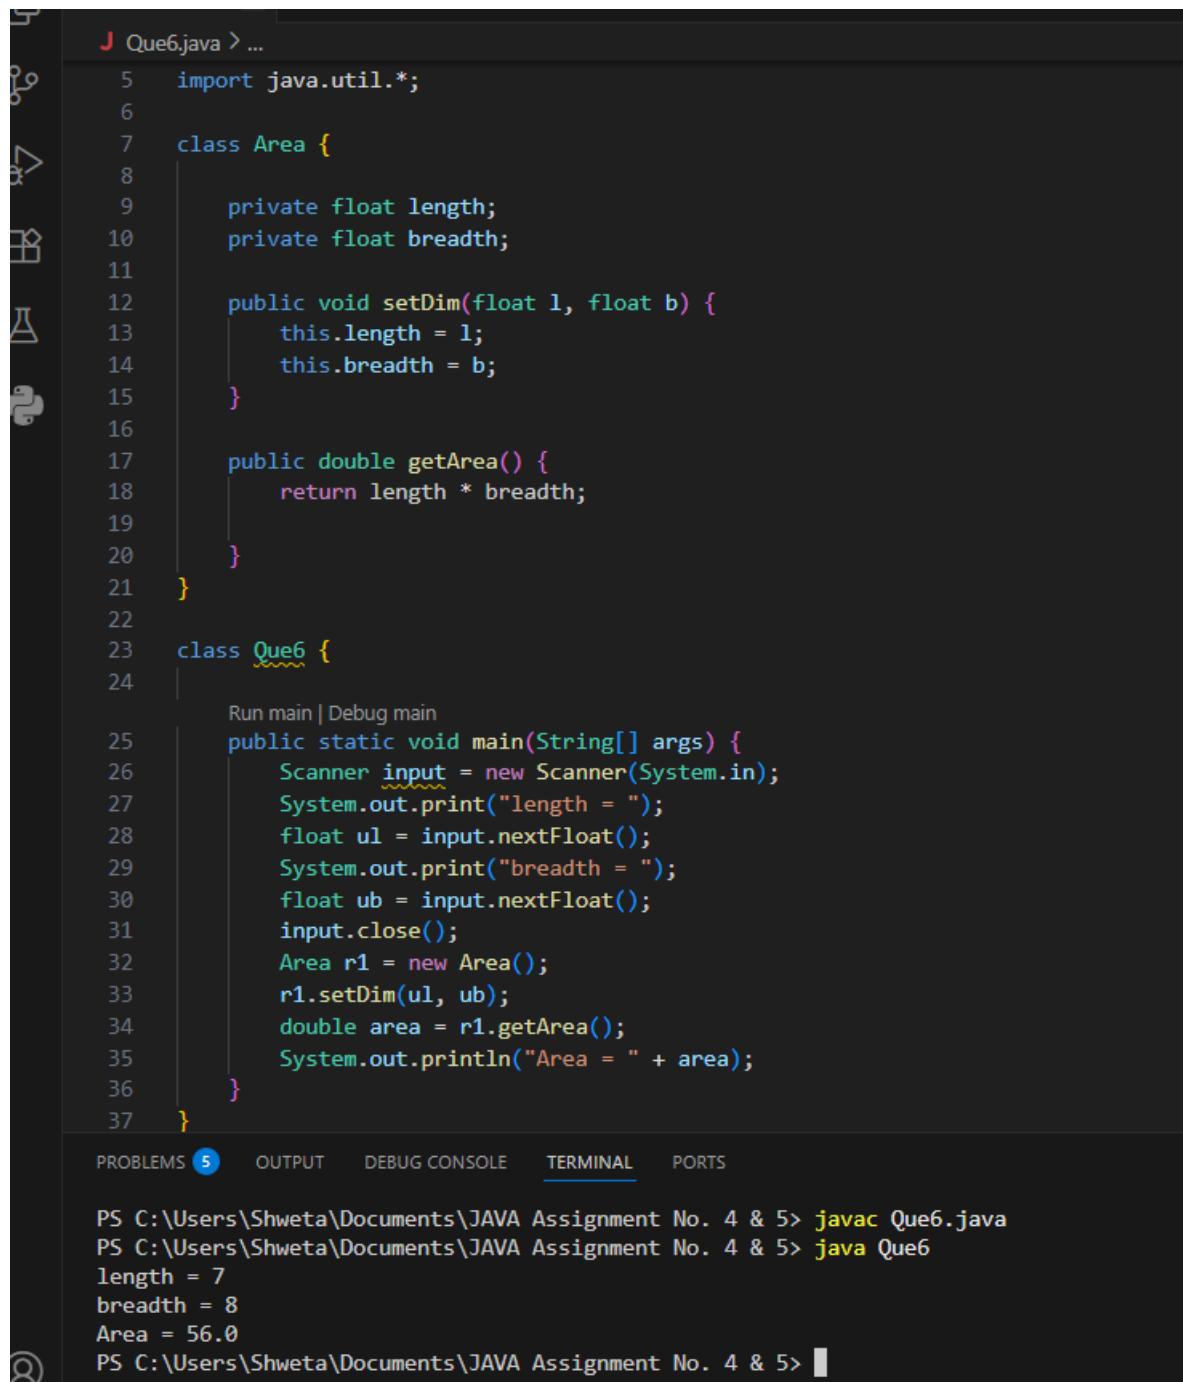

The screenshot shows a Java code editor with the file `Que5.java` open. The code defines a `Rectangle` class with a constructor taking length and breadth, and an `Area()` method returning the product of length and breadth. It also contains a `main` method that creates two `Rectangle` objects with sides (4,5) and (5,8), and prints their areas. Below the code editor is a terminal window showing the execution of `javac Que5.java` and `java Que5`, with the output showing the areas 20.0 and 40.0.

```
1  /*5. Write a program to print the area of two rectangles having sides (4,5) and (5,8) respectively by
2  creating a class named 'Rectangle' with a method named 'Area' which returns the area and length and breadth passed as parameters to its
3  constructor.
4
5  float length;
6  float breadth;
7
8  public Rectangle(float l, float b) {
9      this.length = l;
10     this.breadth = b;
11 }
12
13 public float Area() {
14     return length * breadth;
15 }
16 }
17
18 class Que5 {
19
20     public static void main(String[] args) {

9. Print the sum, difference and product of two complex numbers by creating a class named 'Complex' with separate methods for each operation whose real and imaginary parts are entered by the user.

The screenshot shows a Java code editor with the following code:

```
J Que9.java > ⌂ Que9 > main(String[] args)
1  /*9. Print the sum, difference and product of two complex numbers by creating a class named
2   'Complex' with separate methods for each operation whose real and imaginary parts are entered by the user.
3   */
4  import java.util.*;
5
6  class Complex {
7
8      private double real;
9      private double imaginary;
10
11     public Complex(double real, double imaginary) {
12         this.real = real;
13         this.imaginary = imaginary;
14     }
15
16     public void sum(Complex com1) {
17         double newReal = this.real + com1.real;
18         double newImaginary = this.imaginary + com1.imaginary;
19         System.out.println("Sum: " + newReal + " + " + newImaginary + "i");
20     }
21
22     public void difference(Complex com1) {
23         double newReal = this.real - com1.real;
24         double newImaginary = this.imaginary - com1.imaginary;
25         System.out.println("Difference: " + newReal + " + " + newImaginary + "i");
26     }
27
28     public void product(Complex com1) {
29         double newReal = (this.real * com1.real) - (this.imaginary * com1.imaginary);
30         double newImaginary = (this.real * com1.imaginary) + (this.imaginary * com1.real);
31         System.out.println("Product: " + newReal + " + " + newImaginary + "i");
32     }
33 }
34
35 public class Que9 {
36
37     public static void main(String[] args) {
38         Scanner input = new Scanner(System.in);
39         System.out.println("first complex number - ");
40         System.out.print("Real part: ");
41         double real1 = input.nextDouble();
42         System.out.print("Imaginary part: ");
43         double imaginary1 = input.nextDouble();
44         Complex num1 = new Complex(real1, imaginary1);
45         System.out.println("second complex number - ");
46         System.out.print("Real part: ");
47         double real2 = input.nextDouble();
48         System.out.print("Imaginary part: ");
49         double imaginary2 = input.nextDouble();
50         Complex num2 = new Complex(real2, imaginary2);
51         input.close();
52         System.out.println("Sum    Difference    Product -----");
53         num1.sum(num2);
54         num1.difference(num2);
55         num1.product(num2);
56     }
57 }
```

The code defines a `Complex` class with methods for sum, difference, and product. It also defines a `Que9` class with a `main` method that reads two complex numbers from the user and prints their sum, difference, and product.

The terminal output shows the execution of the program:

```
first complex number -
Real part: 8
Imaginary part: 9
second complex number -
Real part: 7
Imaginary part: 9
Sum    Difference    Product -----
Sum: 15.0 + 18.0i
Difference: 1.0 + 0.0i
Product: -25.0 + 135.0i
PS C:\Users\Shweta\Documents\JAVA Assignment No. 4 & 5> [ ]
```

10. Write a program that would print the information (name, year of joining, salary, address) of three employees by creating a class named 'Employee'. The output should be as follows:

11. Write a Java class Clock for dealing with the day time represented by hours, minutes, and seconds. Your class must have the following features:

- Three instance variables for the hours (range 0 - 23), minutes (range 0 - 59), and seconds (range 0 - 59).
- Three constructors:
  - default (with no parameters passed; it should initialize the represented time to 12:0:0)
  - a constructor with three parameters: hours, minutes, and seconds.
  - a constructor with one parameter: the value of time in seconds since midnight (it should be converted into the time value in hours, minutes, and seconds)
- Instance methods:
  - a *set*-method method setClock() with one parameter *seconds* since midnight (to be converted into the time value in hours, minutes, and seconds as above).
  - get*-methods getHours(), getMinutes(), getSeconds() with no parameters that return the corresponding values.
  - set*-methods setHours(), setMinutes(), setSeconds() with one parameter each that set up the corresponding instance variables.
  - method tick() with no parameters that increments the time stored in a Clock object by one second.
  - method addClock() accepting an object of type Clock as a parameter. The method should add the time represented by the parameter class to the time represented in the current class.
  - Add an instance method toString() with no parameters to your class. toString() must return a String representation of the Clock object in the form "(hh:mm:ss)", for example "(03:02:34)".
  - Add an instance method tickDown() which decrements the time stored in a Clock object by one second.
  - Add an instance method subtractClock() that takes one Clock parameter and returns the difference between the time represented in the current Clock object and the one represented by the Clock parameter.  
Difference of time should be returned as a clock object.

Write a separate class ClockDemo with a main() method. The program should:

- instantiate a Clock object firstClock using one integer *seconds* since midnight obtained from the keyboard.
- tick the clock ten times by applying its *tick()* method and print out the time after each tick.
- Extend your code by appending to it instructions instantiating a Clock object secondClock by using three integers (hours, minutes, seconds) read from the keyboard.
- Then tick the clock ten times, printing the time after each tick.
- Add the secondClock time in firstClock by calling the method addClock. • Print both clock objects calling *toString* method

Create a reference thirdClock that should reference the object of difference of firstClock and secondClock by calling the method *subtractClock()*.

```
J ClockQue.java > 🏃 ClockQue > 📄 main(String[] args)
4   class Clock {
98
99       public Clock subtractClock(Clock c) {

### Question 3

Write a Java class Complex for dealing with complex numbers. Your class must have the following features:

- Instance variables :

**realPart** for the real part of type double

**imaginaryPart** for imaginary part of type double.

- Constructor:

**public Complex ()**: A default constructor, it should initialize the number to (0, 0)

**public Complex (double realPart, double imaginaryPart)**: A constructor with parameters, it creates the complex object by setting the two fields to the passed values.

- Instance methods:

**public Complex add (Complex otherNumber)**: This method will find the sum of the current complex number and the passed complex number. The method returns a new Complex number which is the sum of the two.

**public Complex subtract (Complex otherNumber)**: This method will find the difference of the current complex number and the passed complex number. The method returns a new Complex number which is the difference of the two.

**public Complex multiply (Complex otherNumber)**: This method will find the product of the current complex number and the passed complex number. The method returns a new Complex number which is the product of the two.

**public Complex divide (Complex otherNumber)**: This method will find the ... of the current complex number and the passed complex number. The method returns a new Complex number which is the ... of the two.

**public void setRealPart (double realPart)**: Used to set the real part of this complex number.

**public void setImaginaryPart (double realPart)**: Used to set the imaginary part of this complex number.

**public double getRealPart()**: This method returns the real part of the complex number

**public double getImaginaryPart()**: This method returns the imaginary part of the complex number

**public String toString()**: This method allows the complex number to be easily printed out to the screen

Write a separate class **ComplexDemo** with a main() method and test the Complex class methods.

The screenshot shows the Visual Studio Code interface with the following details:

- File Explorer:** Shows the file path: ComplexNumQue.java > Complex > Complex(double realPart, double imaginaryPart).
- Code Editor:** Displays Java code for a Complex class with methods for addition, subtraction, multiplication, and division.
- Terminal:** Shows the command-line output of running the Java code. It includes:
  - Compiling the Java file: PS C:\Users\Shweta\Documents\JavaAssign1code> javac ComplexNumQue.java
  - Running the Java program: PS C:\Users\Shweta\Documents\JavaAssign1code> java ComplexNumQue.java
  - Output of the program:
    - First Number: 3.0 + 2.0i
    - Second Number: 1.0 + 7.0i
    - Sum: 4.0 + 9.0i
    - Difference: 2.0 - 5.0i
    - Product: -11.0 + 23.0i
    - Quotient: 17.0 - 19.0i

## Question 4

Write a Java class Author with following features:

- Instance variables :

**firstName** for the author's first name of type String.

**lastName** for the author's last name of type String.

- Constructor:

**public Author (String firstName, String lastName)**: A constructor with

parameters, it creates the Author object by setting the two fields to the passed values.

- Instance methods:

**public void setFirstName (String firstName)**: Used to set the first name of the author.

**public void setLastName (String lastName)**: Used to set the last name of the author.

**public double getFirstName()**: This method returns the first name of the author.

**public double getLastNAme()**: This method returns the last name of the author.

**public String toString()**: This method printed out author's name to the screen

```
15  class Author {  
16  
17      String firstName;  
18      String lastName;  
19  
20      public Author(String fn, String ln) {  
21          this.firstName = fn;  
22          this.lastName = ln;  
23      }  
24  
25      public void setFirstName(String fn) {  
26          this.firstName = fn;  
27      }  
28  
29      public void setLastName(String ln) {  
30          this.lastName = ln;  
31      }  
32  
33      public String getFirstName() {  
34          return firstName;  
35      }  
36  
37      public String getLastNAme() {  
38          return lastName;  
39      }  
40  
41      public String toString() {  
42          return firstName + " " + lastName;  
43      }  
44  }  
45  class AuthorQue {  
46      public static void main(String[] args) {  
47          Author a = new Author("Maharshi", "Valmiki");  
48          System.out.println("Author = " + a.toString());  
49          a.setFirstName("Tulsi");  
50          a.setLastName("Das");  
51          System.out.println("First Name = " + a.getFirstName());  
52          System.out.println("Last Name = " + a.getLastNAme());  
53      }  
54  }  
--
```

PROBLEMS 29 OUTPUT DEBUG CONSOLE TERMINAL PORTS

```

Last Name = Das  
PS C:\Users\Shweta\Documents\JavaAssign1code> []
```

Write a Java class Book with following features:

- Instance variables :

**title** for the title of book of type String.

**author** for the author's name of type String.

**price** for the book price of type double.

- Constructor:

**public Book (String title, Author name, double price)**: A constructor with parameters, it creates the Author object by setting the fields to the passed values.

- Instance methods:

**public void setTitle(String title)**: Used to set the title of a book.

**public void setAuthor(String author)**: Used to set the name of the author of a book.

**public void setPrice(double price)**: Used to set the price of a book.

**public double getTitle()**: This method returns the title of the book.

**public double getAuthor()**: This method returns the author's name of the book.

**public String toString()**: This method printed out book's details to the screen

```

C:\> Users > Shweta > Documents > JavaAssign1code > BookQue.java > Book > getPrice()

Write a separate class **BookDemo** with a main() method creates a Book titled “Developing Java Software” with authors Russel Winder and price 79.75. Prints the Book’s string representation to standard output (using System.out.println).

1. Write a program by creating an 'Employee' class having the following methods and print the final salary.

1 - 'getInfo()' which takes the salary, number of hours of work per day of employee as parameter  
2 - 'AddSal()' which adds \$10 to the salary of the employee if it is less than \$500.

3 - 'AddWork()' which adds \$5 to the salary of an employee if the number of hours of work per day is more than 6 hours.

```
5  */
6  class Employee {
7      double sal;
8      int hrs;
9      void getInfo(double s, int h) {
10         this.sal = s;
11         this.hrs = h;
12     }
13     void addSal() {
14         if (this.sal < 500) {
15             this.sal += 10;
16         }
17     }
18     void addWork() {
19         if (this.hrs > 6) {
20             this.sal += 5;
21         }
22     }
23     void printSal() {
24         System.out.println("Total Salary = " + this.sal);
25     }
26 }
27 class EmployeeSal {
28
Run main | Debug main
29     public static void main(String[] args) {
30         Employee emp = new Employee();
31         emp.getInfo(900.0, 7);
32         emp.addSal();
33         emp.addWork();
34         emp.printSal();
35         Employee emp1 = new Employee();
36         emp1.getInfo(200.0, 4);
37         emp1.addSal();
38         emp1.addWork();
39         emp1.printSal();
40     }
41 }
```

2. Create a class called 'Matrix' containing a constructor that initializes the number of rows and number of columns of a new Matrix object. The Matrix class has the following information:

1 - number of rows of matrix

2 - number of columns of matrix

3 - elements of matrix in the form of 2D array

```
J MatrixQue1.java > Matrix > fillMatrix()
 7  class Matrix {
 8
 9      int rows;
10     int columns;
11     int[][] elements;
12
13     Matrix(int rows, int columns) {
14         this.rows = rows;
15         this.columns = columns;
16         elements = new int[rows][columns];
17     }
18
19     public void fillMatrix() {
20         for (int i = 0; i < rows; i++) {
21             for (int j = 0; j < columns; j++) {
22                 elements[i][j] = i + j;
23             }
24         }
25     }
26
27     public void displayMatrix() {
28         for (int i = 0; i < rows; i++) {
29             for (int j = 0; j < columns; j++) {
30                 System.out.print(elements[i][j] + " ");
31             }
32             System.out.println();
33         }
34     }
}

```

PROBLEMS    OUTPUT    DEBUG CONSOLE    TERMINAL    PORTS

```
PS C:\Users\Shweta\Documents\JavaAssign1code> java MatrixQue1
Rows = 2
Columns = 2
Elements =
0 1
1 2
PS C:\Users\Shweta\Documents\JavaAssign1code> █
⑧ 0 ▲ 0 Indexing completed
```

3.The Matrix class has methods for each of the following:

- 1 - get the number of rows
- 2 - get the number of columns

3 - set the elements of the matrix at given position (i,j)

4 - adding two matrices. If the matrices are not addable, "Matrices cannot be added" will be displayed.

## 5 - multiplying the two matrices

The screenshot shows a Java code editor with the file `MatrixQue2.java` open. The code defines a `Matrix` class with methods for getting rows and columns, setting elements, and adding other matrices. It also includes a constructor and a multiplication method. Below the code editor is a terminal window showing the execution of the program and its output.

```
J MatrixQue2.java > Matrix > data
9  class Matrix {
11     private int rows;
12     private int cols;
13     private int[][] data;
14
15     Matrix(int rows, int cols) {
16         this.rows = rows;
17         this.cols = cols;
18         this.data = new int[rows][cols];
19     }
20
21     public int getRows() {
22         return this.rows;
23     }
24

### \*1. Constructor Chaining within the Same Class

Create a class **Car** with multiple constructors that initialize different attributes using constructor chaining.

**Problem Statement:**

- Create a class **Car** with attributes **brand**, **model**, and **price**.
- Implement **constructor chaining** within the same class:
  - One constructor should only take the **brand**.
  - Another constructor should take **brand** and **model**.
  - The final constructor should take **brand**, **model**, and **price**.
- Use the **this()** keyword to call other constructors.
- Display car details in each constructor.

**Task:** Create objects using different constructors and observe constructor chaining in action.

```

J CarConstructorQue1.java > Car
13  class Car {
14
15      String brand;
16      String model;
17      double price;
18
19      Car(String b) {
20          this.brand = b;
21          System.out.println("Brand =" + b);
22      }
23
24      Car(String b, String m) {
25          this(b);
26          this.model = m;
27          System.out.println("Model =" + m);
28      }
29
30      Car(String b, String m, double p) {
31          this(b, m);
32          this.price = p;
33          System.out.println("Price =" + p);
34      }
35  }
36
37  public class CarConstructorQue1 {
38
39      public static void main(String[] args) {
40          Car c = new Car("BMW");
41          Car c1 = new Car("Audi", "Q7");
42          new Car("Rolls-Royce", "Phantom", 1000000);
43      }
44  }

```

Model =Phantom
Price =1000000.0
PS C:\Users\Shweta\Documents\JavaAssign1code>

```

## 2. Constructor Chaining Using **super** Keyword (Parent-Child Relationship)

Create a class hierarchy where the child class calls the parent class constructor using **super()**.

### Problem Statement:

- Create a **Person** class with attributes **name** and **age**.
- Create a **Student** class that extends **Person** and has an additional attribute **course**. • Use constructor chaining:
  - **Person** class should have a constructor initializing **name** and **age**.
  - **Student** class should use **super(name, age)** to call the **Person** constructor and then initialize **course**.
- Display details in both constructors.

Task: Create a **Student** object and verify that both constructors (parent and child) are executed in sequence.

```
10  class Person {
11
12      String name;
13      int age;
14
15      Person(String n, int a) {
16          this.name = n;
17          this.age = a;
18          System.out.println("Person: " + n + ",& Age = " + a);
19      }
20  }
21
22  class Student extends Person {
23
24      String course;
25
26      Student(String n, int a, String c) {
27          super(n, a);
28          this.course = c;
29          System.out.println("Course =" + c);
30      }
31  }
32
33  class PersonConstructorQue2 {
34
35      Run main | Debug main
36      public static void main(String[] args) {
37          Student s = new Student("Abc", 21, "DBDA");
38      }
39  }
40
```

```
PS C:\Users\Shweta\Documents\JavaAssign1code> javac PersonConstructorQue2.java
PS C:\Users\Shweta\Documents\JavaAssign1code> java PersonConstructorQue2
Person: Abc,& Age = 21
Course =DBDA
PS C:\Users\Shweta\Documents\JavaAssign1code>
```

### 3. Multi-Level Constructor Chaining (Grandparent → Parent → Child) Demonstrate

constructor chaining in a multi-level inheritance scenario. Problem Statement:

- Create a **Vehicle** class with an attribute **type**.
  - Create a subclass **FourWheeler** with an additional attribute **brand**.
  - Create another subclass **Car** with attributes **model** and **price**.
- Use **multi-level constructor chaining**:
  - **Vehicle** initializes **type**.
  - **FourWheeler** calls **super(type)** and initializes **brand**.
  - **Car** calls **super(type, brand)**, initializes **model**, and **price**.
- Display details at each level.

✓ Task: Create a **Car** object and verify that constructors are executed from parent → child → grandchild .

```
11  class Vehicle {
12
13     String t;
14
15     Vehicle(String t) {
16         this.t = t;
17         System.out.println("Vehicle =" + t);
18     }
19 }
20
21 class FourWheeler extends Vehicle {
22
23     String b;
24
25     FourWheeler(String t, String b) {
26         super(t);
27         this.b = b;
28         System.out.println("Four Wheeler Brand =" + b);
29     }
30 }
31
32 class Car extends FourWheeler {
33
34     String m;
35     double p;
36
37     Car(String t, String b, String m, double p) {
38         super(t, b);
39         this.m = m;
40         this.p = p;
41         System.out.println("Car Model =" + m);
42         System.out.println("Car Price =" + p);
43     }
44 }
45
46 public class VehicalConstructorQue3 {
47
48     Run main | Debug main

## 4. Constructor Chaining in an E-Commerce Scenario

Create an **Order** class where different constructors initialize order details using constructor chaining.

### Problem Statement:

- Create an **Order** class with attributes **orderId**, **customerName**, and **totalAmount**.
- Implement **constructor chaining** within the same class:
  - One constructor initializes only **orderId**.
  - Another constructor initializes **orderId** and **customerName** by calling the first constructor.
  - The final constructor initializes all three attributes (**orderId**, **customerName**, **totalAmount**) by calling the second constructor.
- Display order details.

**Task:** Create **Order** objects using different constructors and verify how chaining works.

```
OrderConstructorQue4.java  Order  Order(int o, String c, double t)
11  class Order {
12
13      int orderId;
14      String customerName;
15      double totalAmount;
16
17      Order(int o) {
18          this.orderId = o;
19          System.out.println("Order ID =" + o);
20      }
21
22      Order(int o, String c) {
23          this(o);
24          this.customerName = c;
25          System.out.println("Customer Name =" + c);
26      }
27
28      Order(int o, String c, double t) {
29          this(o, c);
30          this.totalAmount = t;
31          System.out.println("Total Amount =" + t);
32      }
33  }
34
35  class OrderConstructorQue4 {
36
37      public static void main(String[] args) {
38          Order o = new Order(101);
39          Order o1 = new Order(102, "aaa");
40          Order o2 = new Order(103, "bbb", 1000);
41      }
42  }
43
```

PROBLEMS 23 OUTPUT DEBUG CONSOLE TERMINAL PORTS

```
PS C:\Users\Shweta\Documents\JavaAssign1code> java OrderConstructorQue4
Order ID =101
Order ID =102
Customer Name =aaa
Order ID =103
Customer Name =bbb
Total Amount =1000.0
PS C:\Users\Shweta\Documents\JavaAssign1code>
```

## 5. Constructor Chaining in a Banking System

Create a **BankAccount** class where constructor chaining initializes different account types.

### Problem Statement:

- Create a **BankAccount** class with attributes **accountNumber**, **holderName**, and **balance**.
- Implement **constructor chaining**:
  - One constructor initializes only **accountNumber**.
  - Another constructor initializes **accountNumber** and **holderName**, calling the first constructor.
  - The final constructor initializes all three attributes by calling the second constructor.
- Implement a method to **display account details**.

**Task:** Create **BankAccount** objects using different constructors and verify the constructor call sequence.

The screenshot shows the Visual Studio Code interface with the following details:

- Left Sidebar:** Includes icons for file operations (New, Open, Save, Find, Replace, Delete), a search bar, and a gear icon.
- Code Editor:** Displays two Java files:
  - BankAccount.java:** Contains a class definition with three constructors (long accountNumber, long accountNumber, String holderName, double balance) and a show() method that prints account number, holder name, and balance.
  - BankAccountConstructorQue5.java:** Contains a main() method that creates three BankAccount objects (a1, a2, a3) with different parameters and calls their show() methods.
- Terminal:** Shows the command-line output of running the code:

```
PS C:\Users\Shweta\Documents\JavaAssign1code> javac BankAccountConstructorQue5.java
PS C:\Users\Shweta\Documents\JavaAssign1code> java BankAccountConstructorQue5
Account Number =77777777
Holder Name =null
Balance =0.0
Account Number =67676767
Holder Name =Aaa
Balance =0.0
Account Number =78787878
Holder Name =Bbbb
Balance =10000.0
PS C:\Users\Shweta\Documents\JavaAssign1code>
```
- Bottom Bar:** Includes tabs for PROBLEMS (23), OUTPUT, DEBUG CONSOLE, TERMINAL (selected), and PORTS.
